

IN THE CLAIMS:

1. (Currently Amended) A communication device comprising casing parts enclosing a microphone and a receiver and suspension points therefore in the casing, further including a sound canal from the receiver to an ear of a user, and wherein at least one of the casing parts is shaped from an injection moulded fibre-reinforced ~~polymer~~ polyarylamide-based compound which has a fibre content between 30% and 75% by weight and an E-module which is higher than 13 MPa.

2. (Previously Presented) The communication device as claimed in claim 1, wherein the fibre content is between 40% and 60% by weight.

3. (Currently Amended) The communication device as claimed in claim 1, wherein ~~the reinforced polymer is a polyarylamide-based compound and~~ the fibre-reinforcement comprises glass fibres.

4. (Cancel)

5. (Canceled)

6. (Previously Presented) The communication device as claimed in claim 1, wherein the reinforced polymer compound has an E-module which is higher than 15 MPa.

7. (Previously Presented) The communication device as claimed in claim 1, wherein the reinforced polymer compound has an E-module which is higher than 18 MPa.

8. (Previously Presented) The communication device as claimed in claim 1, including a receiver enclosure which has wall parts forming part of the casing which in cooperation with detachable wall parts form the enclosure in an air tight manner for sound isolation of the receiver.

9. (Previously Presented) The communication device as claimed in claim 8, wherein at least shell and wall parts forming the receiver enclosure are shaped from an injection moulded fibre-reinforced polymer.

10. (Previously Presented) The communication device as claimed in claim 1, wherein the casing comprises a first and a second part which are tightly joined along respective edge lines whereby a flexible packing or gasket material is provided in the edge line between the two casing parts.
